----Preface

Typographical Conventions

The typefaces used in this manual, summarized below, emphasize important concepts. All references to filenames and commands are case-sensitive and should be typed accurately.

Kind of Text	Examples
Body text; <i>italicized</i> for emphasis, new terms, and book titles	Refer to the LynxOS-178 User's Guide
Environment variables, filenames, functions, methods, options, parameter names, path names, commands, and computer data	<pre>ls -l myprog.c /dev/null</pre>
Commands that need to be	login: myname
highlighted within body text or commands that must be typed as is by the user are bolded .	# cd /usr/home
Text that represents a variable, such	cat <filename></filename>
as a filename or a value that must be entered by the user, is <i>italicized</i> .	mv <file1> <file2></file2></file1>
Blocks of text that appear on the display screen after entering	Loading file /tftpboot/shell.kdi into 0x4000
instructions or command	
	File loaded. Size is 1314816
	$\ensuremath{\mathbb{G}}$ 2015 Lynx Software Technologies, Inc. All rights reserved.
Keyboard options, button names, and menu sequences	Enter, Ctrl-C

Technical Support

Lynx Software Technologies handles support requests from current support subscribers. For questions regarding Lynx Software Technologies products, evaluation CDs, or to become a support subscriber; our knowledgeable sales staff will be pleased to help you. Please visit us at:

http://www.lynx.com/training-support/contact-support/

How to Submit a Support Request

When you are ready to submit a support request, please include *all* of the following information:

- First name, last name, your job title
- Phone number, e-mail address
- Company name, address
- · Product version number
- Target platform (for example, PowerPC)
- Board Support Package (BSP), Current Service Pack Revision, Development Host OS version
- Detailed description of the problem that you are experiencing:
- Is there a requirement for a US Citizen or Green Card holder to work on this issue?
- Priority of the problem Critical, High, Medium, or Low?

LynxOS-178 Documentation Set

The LynxOS-178 Documentation Set includes the following:

- LynxOS-178 Installation Guide
- LynxOS-178 User's Guide
- LynxOS-178 ARINC 653 Conformance Document
- LynxOS-178 ARINC 653 Migration Guide
- LynxOS-178 POSIX Conformance Document
- LynxOS-178 FACE Conformance Document
- LynxOS-178 FACE Conformance Verification Matrix
- LynxOS-178 Device Driver Writer's Guide
- LynxOS-178 Health Monitor Application Writer's Guide
- LynxOS-178 Advanced Porting Kit Guide for ARM
- LynxOS-178 ZCU102 Board Support Guide
- LynxOS-178 ZC702 Board Support Guide
- LynxOS-178 Lynx Certifiable Stack User's Guide
- Luminosity User's Guide
- FLEXLM License Manager documentation

CHAPTER 1 Overview

Introduction

These release notes provide information about the following:

- New Features
- Supported Cross-Development Configurations
- Supported Board Support Packages
- Changes to existing features
- Obsolescent features, files and directories
- Development host requirements
- LCS Features
- Known Issues and Limitations

New Features

The following new features are included in this release:

- Support for the Supermicro X10SDV-TLN4F target
- Support for the Xtreme Engineering 7674 target
- Support for the Xilinx Zynq Ultrascale+ MPSoc ZCU102 target
- Support for the Xilinx Zynq 7000 Cortex A9 ZC702 target
- Changes to accommodate time beyond the year 2038
- Updated GCC 7.1 tool chains that support army 7 core and x86
- USB 3.0 support
- Support for the lsk fifo driver (the zcu102 and x86 pv BSPs)
- Luminosity based on Eclipse version 4.7.0 IDE and CDT version 9.3.0 which contains the support for new target boards mentioned in this document
- This release is compatible with Lynx Certifiable Stack (LCS) version 2.2.0

Supported Cross-Development Configurations

A Cross-Development Environment consists of a Cross-Development Host running on a platform that is different from the intended target board. LynxOS-178 applications are developed with the LynxOS-178 Cross-Development Kit (CDK) on the Cross-Development Host and then downloaded onto the target board.

The following Cross-Development Environments are supported:

- Microsoft Windows:
 - Windows 7 Professional, SP1 (64-bit)
 - Windows 10 Professional (64-bit)
- Linux Workstations:
 - CentOS 7.2 (64-bit)
 - CentOS 7.3 (64-bit)
 - CentOS 7.4 (64-bit)
 - CentOS 7.5 (64-bit)

Note: Other newer compatible versions may also work. However, they have not been tested

Supported Board Support Packages

The following table describes the supported Board Support Packages (BSPs) for this release.

Table 1-1: Supported BSPs

BSP Name	Boards Supported
x86_pv	Supermicro X10SDV-TLN4F, XES 7674 Boards
zcu102	Xilinx Zynq Ultrascale+ MPSoc ZCU102 Evaluation Board
zc702	Xilinx Zynq 7000 Cortex A9 ZC702 Evaluation Board

Changes to Existing Features

The following features are improved in this release:

- Support for binaries without BSS or data sections is added.
- Dynamic drivers are automatically installed to the /sys/dldd directory.
- Disk IO reading performance is increased due to block cache optimization.
- The rs232 driver is updated to require a single serial port.
- System call numbering is changed. Currently, system calls do not have pre-defined numbers. Numbers are assigned automatically according to the order of the system call entries in the sys/syscalls/syscall.master file. The resultant system call numbers are located in the usr/include/machine/syscall_nums_arm.h header which is automatically included from usr/include/syscall_nums.h.
- An ability to boot LynxOS-178 without configured serial port on the zcu102 and x86_pv targets is added.
- ARINC653 Enhancements:
 - ARINC 653 support has been modified to better follow the ARINC standard. See the ARINC 653 Migration Guide for details.
 - WAIT_FOR_NORMAL_MODE() has been removed.
 - arinc653_module_channel_ports_allocate() has been updated to verify given port values.
- POSIX Enhancements:
 - POSIX support has been updated to better conform to the POSIX.1-2008 version of the standard.
 - Support for clock nanosleep () has been added.
 - Support for posix_spawnp() and posix spawn file actions destroy() has been added.
 - Support for the SA_RESETHAND flag in sigaction() API has been added.
 - Now multiple pending unblocked realtime signals are delivered to user applications in order from the lowest numbered signal to the highest numbered signal.
- FACE Support:
 - The following HMFM Services APIs have been added:

Table 1-2: Added HMFM Services APIs

Function Name
Initialize()
Create_Fault_Handler()
Report_Application_Message()
<pre>Get_Fault_Status()</pre>
Raise_Application_Fault()

The following functions previously available in production mode have been made available in development mode only:

Table 1-3: Functions Removed from Production Mode

posix_spawnattr_setpgroup() posix_spawnattr_setschedparam() posix_spawnattr_setschedpolicy()	<pre>posix_spawnattr_init()()</pre>
posix_spawnattr_setschedparam() posix_spawnattr_setschedpolicy()	posix_spawnattr_setflags()
posix_spawnattr_setschedpolicy()	
posix_spawnattr_setsigdefault()	posix_spawnattr_setschedpolicy()
	posix_spawnattr_setsigdefault()

Table 1-3: Functions Removed from Production Mode (Continued)

Function Name
posix_spawnattr_setsigmask()
posix_spawn_file_actions_addclose()
<pre>posix_spawn_file_actions_adddup2()</pre>
posix_spawn_file_actions_addopen()
posix_spawn_file_actions_init()

New Directories

There are the following new directories in this release:

Table 1-4: New Directories

Directory Name
/sys/dldd
/sys/family
/sys/family/arm
/sys/family/x86

Deprecated Items

The following features, files, and directories are deprecated:

- The -mthreads linker flag used to link with the multi-threaded libraries is no longer needed as all multi-threaded libraries are located in the default /lib directory.
- The libsyscalls a library is removed. The system call related object files are part of the libfamily_<arch> a library (where <arch> is arm or x86).
- Content of the /sys/family.<arch> directory is moved to the /sys/family/<arch> directory (where <arch> is arm or x86).
- Single-threaded libraries are not supported, the /lib directory currently contains multi-threaded versions of all libraries. The /lib/thread directory is removed.
- All device driver files (cfg, header, info, and driver source) are
 collocated in a single directory for each device driver. As a result, the
 /sys/dheaders and /sys/devices directories are obsoleted. In
 addition, the device info files are moved to the driver library
 (libdrivers.a) and the device library (libdevices.a) is
 removed.

Table 1-5: Deprecated Files and Directories

File or Directory Name
/lib/thread
/sys/dheaders
/sys/devices
/sys/family.arm
/sys/family.x86
/sys/lib/libdevices.a
/sys/lib/libsyscalls.a

• The following files were initially created to allow source code to compile even if it did not use the correct paths to include POSIX header files. POSIX applications should be modified to use the correct paths when including POSIX header files. The following header files are removed:

Table 1-6: Deprecated Header Files

File Name
/usr/include/sys/aio.h
/usr/include/sys/assert.h
/usr/include/sys/ctype.h
/usr/include/sys/dirent.h
/usr/include/sys/errno.h
/usr/include/sys/fcntl.h
/usr/include/sys/float.h
/usr/include/sys/ftw.h
/usr/include/sys/grp.h
/usr/include/sys/limits.h
/usr/include/sys/locale.h
/usr/include/sys/math.h
/usr/include/sys/mqueue.h
/usr/include/sys/netdb.h
/usr/include/sys/poll.h
/usr/include/sys/pthread.h
/usr/include/sys/pwd.h
/usr/include/sys/sched.h
/usr/include/sys/search.h
/usr/include/sys/semaphore.h
/usr/include/sys/setjmp.h
/usr/include/sys/signal.h
/usr/include/sys/stdarg.h
/usr/include/sys/stddef.h
/usr/include/sys/stdio.h

/usr/include/sys/strings.h
/usr/include/sys/stropts.h
/usr/include/ipc.h
/usr/include/mman.h
/usr/include/msg.h
/usr/include/resource.h
/usr/include/select.h
/usr/include/sem.h
/usr/include/shm.h
/usr/include/socket.h
/usr/include/stat.h
/usr/include/times.h

Table 1-6: Deprecated Header Files (Continued)

File Name
/usr/include/types.h
/usr/include/uio.h
/usr/include/un.h
/usr/include/utsname.h
/usr/include/wait.h
/usr/include/sys/syslog.h
/usr/include/sys/tar.h
/usr/include/sys/termios.h
/usr/include/sys/unistd.h
/usr/include/sys/utime.h

Development Host Requirements

The following system requirements are recommended for the host development system:

- X86 64-bit machine running CentOS 7.2 (1511) or later (7.3-7.5)
- X86 64-bit machine running Windows 7 Professional SP1 or Windows 10 Professional
- Standard set of GNU/ Linux Utilities (the bash shell must be used on the cross development host)
- At least 4GB RAM
- At least 5GB free disk space for the binary product installation
- At least 2GB free disk space for the source product installation

LCS Features

This release of LCS provides the following features:

- Awareness of the LynxOS-178 partitioning. Several partitions in the system can use the LCS TCP/IP stack simultaneously without affecting each other.
- · Development and production modes support.
- Support up to 8 interfaces (including loopback) per VM.
- Supported drivers for the following Networking Controllers:
 - ZCU102 GEM
 - ZC702 GEM
 - The loopback pseudo device.
 - Inter-partition communications.
- · Compatibility with standard network features:
 - ftpand ftpd
 - tftp and tftpd
 - ntpd
 - net-snmp
 - rshd and rlogind
 - arp
 - ifconfig, route, tcpdump/libpcap, and ping
- The following protocols are certifiable to DO-178C Level A:
 - IPv4
 - ICMP
 - ARP
 - UDP(limited support)
- The following socket options are supported:
 - SO SNDBUF
 - SO RCVBUF
 - SO TYPE
 - SO ERROR
- The following protocols are certifiable to DO-178C Level B:
 - IPv4
 - ICMP
 - ARP
 - UDP
 - TCP
 - IGMP

- The following socket options are supported:
 - SO SNDBUF
 - SO RCVBUF
 - SO TYPE
 - SO ERROR
 - IP TOS
 - IP MULTICAST IF
 - IP MULTICAST TTL
 - IP MULTICAST LOOP
 - IP ADD MEMBERSHIP
 - IP DROP MEMBERSHIP
 - SO BROADCAST
 - SO_LINGER
- The PF_INET protocol family for the SOCK_RAW, SOCK_DGRAM, and SOCK_STREAM socket types
- The PF ROUTE protocol family for the SOCK RAW socket types
- Configurable TCP/IP stack parameters
- · Static and dynamic ARP
- Support of routing (except packet forwarding)

- CHAPTER 2 Known Issues and Limitations

General Limitations

- The USB driver supports only Mass Storage and Hub device classes in this release.
- The readdir() function does not support detection of an invalid directory stream pointer argument. Calling readdir() with an uninitialized DIR *dirp pointer, or with a released pointer due to a previous call to closedir(), may result in unpredictable results. The applications must ensure that the dirp argument passed to readdir() is valid and properly initialized. However, it must be noted that the current version of the POSIX.1 standard does not require that the readdir() function detect such a condition, and lists the EBADF error code as optional.
- The pthread_mutexattr_setpshared() and
 pthread_condattr_setpshared() APIs do not provide intended
 functionality. A request for PTHREAD_PROCESS_PRIVATE is silently
 ignored and functionality equivalent to PTHREAD_PROCESS_SHARED is
 always enforced by default or otherwise.

Open Software Issues

 High speed data traffic between a LynxOS-178 x86 guest and the Virtual Device Server (VDS) should be limited to configurations where ssh is used to connect from the host to the VDS rather than using a physical serial port.

When using the paravirtual UART (pvuart) driver to communicate with the VDS which has a physical serial port assigned to it, it is possible to lose data if the data transmission rate from the LynxOS-178 guest to the VDS exceeds the speed at which the VDS is able to transmit the data over the physical serial port.

The point at which data may be lost depends on the rate at which data is written to the pvuart device, the load on the VDS and the speed of the physical serial port.

If data loss does occur, the user should either reduce the rate at which data is written to the pyuart device or use ssh to connect to the VDS rather than using a physical serial port.

- The LynxOS-178 guest fails to initialize low, high and full speed USB devices after reboot on the ARM Ultrascale+ target. Configuration of the LynxOS-178 guest OS for the ARM Ultrascale+ target requires USB to be passed with @ suffix to avoid the problem with low, high and full speed devices initialization after guest reboot.
- The UNIX socket can be written to (read from) after <code>shutdown()</code> has been called on it. Using the <code>shutdown()</code> routine for the UNIX socket puts the socket pipes into the list of the kernel free files, however these pipes continue to be used by this socket. It can result in the same 'struct file' being used by different kernel objects at the same time.
- Thread's signal mask is not restored correctly when user calls siglongjmp() from a signal handler.
- POSIX requires that FE_INVALID exception to be set for signaling NANs. The libm APIs return NAN for any NAN arguments leaving errno unmodified and do not raise any floating point exceptions when signaling NANs are passed.
- The USE_CLOCK_TABLE() and DONE_CLOCK_TABLE() macros implement a reference counting mechanism (for clocks other than CLOCK_REALTIME) indicating that a particular clock entry in the clock description table is in use to prevent a concurrent clock_deregister() from removing the clock. These macros do not have any locking which may lead to a race condition.
- The link(), rename() and unlink() calls do not distinguish between files and directory names.

- The pthread_mutexattr_setpshared() and
 pthread_condattr_setpshared() APIs do not provide intended
 functionality. Any request for PTHREAD_PROCESS_PRIVATE is silently
 ignored and functionality equivalent to PTHREAD_PROCESS_SHAREDis
 always enforced by default or otherwise.
- The symlink() syscall can change the last modification time of the parent directory of a symlink to be created even if a symlink itself cannot be created (system call fails with ENOSPC for example).
- In some conditions, the ftruncate() system call cannot be interrupted by a signal.

Installation Issues

General Issues

- After uninstalling LynxOS-178 product, certain files added in the product tree
 by the user after installation will be left. Please remove these files and
 directories manually if they are not needed any more.
- When a product component is uninstalled, all files that it consists of are removed. Given that there are files that are included in multiple product components (e.g., BSP and APK components have common files), uninstalling an individual component may leave other components incomplete. To prevent this issue, the entire product should be uninstalled as a unit and then only the required set of components should be reinstalled.

Windows Host Issues

When using Windows as the Cross-Development host, the existence of Windows line termination characters in the /etc/hosts file prevents the developer KDI from automatically enabling networking. To enable networking, the user must execute the ifconfig <interface_name> <ip_address> up command. Please use the ifconfig -a command to get full list of available interface names.

Luminosity Issues General Issues

• If Luminosity runs on Centos 6.6 with cairo version less than 1.9.4 and GTK version greater or equal 2.24, Luminosity can crash printing the following error message:

```
java: cairo-misc.c:380:
    _cairo_operator_bounded_by_source: Assertion
    `NOT REACHED' failed .
```

To fix this, add the following line in the end of the

```
<inst_dir>/eclipse/luminosity.ini file:
```

```
-Dorg.eclipse.swt.internal.gtk.cairoGraphics=false
```

where *<inst dir>* is a Luminosity installation directory.

 If Luminosity runs on CentOS 7.x with GTK version 3.22.x, Luminosity can slow down or even crash printing the following messages on the screen:

```
(Luminosity:29675): Gtk-WARNING **: Negative content width -6 (allocation 1, extents 4x3) while allocating gadget (node toolbar, owner GtkToolbar)
```

```
(Luminosity:29675): Gtk-WARNING **: Negative content height -3 (allocation 1, extents 2x2) while allocating gadget (node toolbar, owner GtkToolbar)
```

To fix this, invoke Luminosity in the environment where the SWT_GTK3 variable is set to 0, e.g.:

```
$ export SWT_GTK3=0
$ ./luminosity
```

- For full operating, Luminosity IDE should be started in the native host environment. That is, the Luminosity IDE should not be started from the shell where . SETUP.bash command is executed to get a Cross-Development Environment. Otherwise, the native C development will be impossible.
- On start, Luminosity IDE can report:

```
No Luminosity license is found. The Lynx plug-ins are disabled.
```

This means that Luminosity cannot find the license. The detailed analysis of the detected problem will be put in the

```
<inst_dir>/eclipse/workspace/.metadata/.log file where
<inst_dir> is a Luminosity installation directory
```

/opt/Lynx/LynxOS-178-2.2.5/Luminosity/6.0.0. As a rule, to fix the problem the following steps can be used:

- On Linux host, set LM_LICENSE_FILE variable before launching Luminosity as:
 - \$ export LM_LICENSE_FILE=<path_to_license_file>
 \$./luminosity
 - where <path_to_license_file> is full path to the license
 file or @<hostname> where <hostname> is a host where
 License Manager lmgrd is running.
- On the Windows host, set LM_LICENSE_FILE variable using
 System->Advanced->Environment Variables dialog and try again.

Installation Issues

Uninstallation of the Luminosity IDE can fail if another user has made an attempt to perform this beforehand. If this occurs, remove the Luminosity installation directory from the command prompt.

Build Issues

- In external projects if the active configuration is changed and the project is rebuilt, information about the executable format displayed in the **Project Explorer** view may be incorrect. To avoid this, collapse the project in the **Project Explorer** view before rebuilding it.
- Sometimes a project can be built twice if the **Build Automatically** option is switched on in the main Projects menu.
- A project is not automatically re-built after the D2U conversion. Use the
 Clean Project menu item to rebuild it.
- Driver project build can fail if the driver entry points duplicate names already present in the Kernel.
- Clicking the Apply and OK buttons in the Project Properties dialog
 while build is running may cause the Luminosity IDE hanging for a few
 minutes.
- If a Kernel project is built, the Duplicate paths warning can appear in the **Problems** view. This warning is generated because the Release and Debug configurations have the same output directory for Kernel projects. Safely ignore this message.
- When a kernel project is built \$ENV PREFIX/etc/ttys and

\$ENV PREFIX/etc/tconfig files in the environment are re-generated.

Project Issues

- When a Cross-Development Environment is removed from the list of platforms supported by a Kernel project, the corresponding directories are not deleted.
- all and clean are reserved for target names in project Makefiles and cannot be used as project names.
- Mutex cannot be used as a project name.
- Some names such as the memory, streambuf, and strings names are
 reserved for C++ header files and cannot be used as project binary
 names. Refer to the Window->Preferences->C/C++->File Types
 dialog for the full list of the reserved names.
- A project cannot be created in a read-only directory. No error messages will be displayed.
- In the VCT editor for LynxOS-178 Kernel projects, if errors are detected during the VCT file parsing, the warning dialog is displayed. The dialog describes the detected errors and asks the user to confirm further actions. In case the user confirms this, the errors are automatically fixed and the editor opens.
- The Luminosity VCT editor does not support VCT files with m4 directives. Do not change such files in the Luminosity Kernel projects by using either external or internal text editors after the pure VCT files without m4 directives are produced by the project build. Instead, use the Remote System Configuration->Edit VM Configuration... item in the context menu to change VM configuration.
- The Luminosity VCT editor can show warning after a new VN is added using the VM tab. Please ignore it.
- In the editor, the built-in C/C++ parser may show errors that are not printed by the compiler on a project build. Ignore these errors as they will disappear after the Luminosity IDE is re-launched.
- The Makefile files in the Kernel and managed driver projects are readonly. On attempt to change them, a dialog suggesting to allow write access privileges appears. Should the user agree to allow write access privileges, all changes will then be lost.
- The Luminosity spec editor does not support spec files with m4 directives. Do not change such files in the Luminosity Kernel projects by using either an external or an internal editor once the pure spec files (without m4 directives) are produced by the project build. Instead,

- change the pure spec file.
- Kernel images built by the Luminosity Kernel and driver projects do not display information about the build date and the Operating System version upon initial booting.
- For Lynx C Projects, the project Properties->Tool Chain Editor dialog shows empty value instead of Lynx toolchain in the Current toolchain box.

Debug and Run Issues

- If the Luminosity IDE or **Debug** view is closed while the debug session
 is still running, the application being debugged may continue running,
 therefore preventing a subsequent upload. As a workaround, close the
 application on the target before uploading.
- Variables in the Variables view might be displayed with an error mark and the subscription Target is not suspended. When the application stops, this error mark disappears.
- An attempt to debug applications built for another platform may cause the Target selection failed error message.
- When multi-thread applications are debugged, the selection in the **Debug** view may be lost.
- Debugging and running applications via the serial line may run unusually slow. Instead, use the network connection if it is possible.
- When exiting a debug session, a gdb exit code different from 0 may be displayed in the **Debug** view.
- When the debugger is stopped inside a function without source code available, the **Editor** view shows the message No source available for (<function>()) and the source of the debugged project disappears. Position the calling stack to move toward the frame with source.
- The Modules view shows shared libraries contents only so it is always empty in LynxOS-178 cross-development debug sessions.
- Opening the debug session may sometimes fail. If this occurs, initiate the operation again.
- A debug session can fail to launch if the **Binaries** folder is not displayed in the **Project Explorer** view. If this occurs, switch between workspaces to restore the folder.
- Serial port sharing between the console and kernel debugger does not LynxOS-178 Release Notes

work at this time.

- The debug control buttons in **Debug** view may become enabled before the debug session is fully established.
- The kernel debugging is not supported.
- Debugging is not supported for LynxOS-178 targets running in Production Mode.
- Post-mortem debugging requires /rwfs directory existing and having write permissions on the target. Otherwise the core file will not be generated.

Host Shell

- The Host Shell view does not support neurses based applications.
- The Delete button works the same way as the Backspace button.
- The Host Shell icon can be disabled on the toolbar if no project is selected. To enable it, click a project or its subdirectory in the Project Explorer view.

Host File System

- A file selected in the Project Explorer view cannot be dragged and dropped in the Host File System view if there is selection on a file entry.
- On the Windows host, changing the read only attribute of a folder is not supported.

Direct Access

- On CentOS 7.x, if SELinux is installed, the direct access to targets/hosts may not work if the selinux-policy RPM package has version 3.7.19-126. Update the packages to version 3.7.19-154 or higher.
- Direct access is not supported for LynxOS-178 targets running in Production Mode.

Remote File System View

- The contents of a directory where the current user has read only permissions is not displayed.
- Working with the Remote File System view via the serial line may

run unusually slow. Instead, use the network connection if it is possible.

- If the Remote File System view is closed while obtaining information from the target, an error message may be displayed.
- The Remote File System view is not supported for LynxOS-178 targets running in Production Mode.

Remote Target System Viewer

- Working with the Remote Target System Viewer via the serial line may run unusually slow. Instead, use the network connection if it is possible.
- The Remote Target System Viewer reports error if started while a kernel debug session is open.
- The **Control** terminal column is empty in the **Processes** view if the LynxOS-178 target is running in Production Mode.
- The Process view displays double lwsrvr process entries if the Show process hierarchy option is enabled.
- The CPU ID column is empty in the Process view if the LynxOS-178 target is running in Production Mode at this time.
- In the **Summary** view, load average values are unavailable for LynxOS-178 targets.
- If a target is rebooted when the Remote Target System Viewer is running, the connection may break and the Reconnect button will be displayed. If clicking this button does not restore the connection, then close all views using the Close All button and click the Remote Target System Viewer icon again.
- The Remote Target System Viewer may fail if the communication between the LOCI Server and LOCI Proxy is performed via a serial line.
- Remote Target System Viewer can stop running sometimes showing the Connection is lost message. Use the Reconnect button to restore connection with the target. This situation can occur, for example, if the date is set incorrectly on the target.
- The preference setting of views that should be opened by clicking the Remote Target System Viewer icon can be ignored.
- Task names are empty in the Tasks view if the target runs in the Production mode.

SpyKer GUI

- After the Zoom tool is used, the ruler may contain no time labels. Scroll the event panel to the left or to the right to show the nearest time label.
- Events with the same timestamp cannot be viewed by the SpyKer tool separately from each other and are always "aggregated" in the display.
- For wrapped traces the SpyKer tool may mislabel the name of a thread when the original thread exits and the thread ID is reused by a new thread.
- To allow the SpyKer tool to load large traces (>2.5 MB), the Java heap size should be no less than 25 times the trace size. To increase the Java heap size, restart Luminosity using the following command:

./luminosity -vmargs -Xmx<size>m

where <size> is the Java heap size in MB.

NOTE: Even larger heap may be required to perform various operations with the trace. If the Java out of memory error message appears, restart Luminosity with an increased Java heap.

• When a trace is opened, the following warning may be displayed:
Warning: there is no one-to-one correspondence between
the Interrupt events in the trace. The following GUI
features may work improperly:
IRQ detailed information (the IRQ tasks)
ISR state indication
ISR Histogram

This means that there is not a one-to-one correspondence between the Interrupt and Return from Interrupt events in a trace. In most cases these warnings can appear if there are overruns during trace capture or if triggers are used.

- When displaying a trace, Luminosity can display the warning message Events are out of order. Safely ignore this message.
- SpyKer can display the following warning messages for traces with the Wrap mode event:

Warning: no supervisor/user mode change events for <thread name> thread after hole.

This means that SpyKer cannot detect the actual state of the <thread name> thread and will assume that this thread is always in the system state.

The message can occur without wrap mode. Then there is no after whole in it.

• Library calls tracing is not supported for LynxOS-178 targets.

- The Measure tool does not resize the measure bar after resizing the window. After using the tool, the scroll bar position does not match an updated window.
- In the **Memory Usage** panel, if the Kernel memory value is negative, the user memory histogram can be outside of the top or bottom edge of the panel.
- Collecting a SpyKer trace via serial line is slow. Use the network connection if possible.
- When a trace is being searched then after the last event is detected, and
 the trace is clicked, the vertical line which marks the found event
 disappears and Event not found is shown in the bottom string. One
 more click starts searching from the point of the trace that is clicked.
- When a new event is added in the SpyKer Events preference dialog, to
 enable the buttons located on the right, click an existing event in the
 appropriate table.
- The SpyKer trace collection may fail if the target is heavily loaded.
- Once a trace is collected and the **Display** button is clicked, the Disconnected. I/O error message can appear in the **Log** box. Please ignore this message.
- If a trace is saved with VM filter, it will be shown as empty. Close the view and display the saved trace in a new view.

GUI Issues

- Remote File, Remote File System, Target System Viewer, SpyKer, Target Login, Application Debugged, and Host Shell views if opened using the Window->Show View menu item do not display any contents. Use corresponding Lynx menu items or toolbar icons to open these views.
- The Luminosity IDE may hang for a few minutes if a large binary is expanded in the **Project Explorer** view.
- Functional keys as well as hot keys can fail to work properly. Use mouse instead.
- Lynx C++ creation wizard can require scrolling.

Targets View

• Switching to a new workspace removes the default target selection.

 Currently, different remote target entries may not possess the same MAC address.

Remote Copy

- When a file is copied to a remote target, the progress bar remains empty not displaying the operation progress.
- Copying files via the serial line may appear slow. Use a network connection if possible.
- Copying files is not supported for LynxOS-178 targets running in Production Mode at this time.

Target Login

Target Login functionality is not supported for LynxOS-178 targets running in Production Mode at this time.

Import

- The Luminosity IDE may not operate properly if an attempt to import a Luminosity project using the Import->General menu item is made. Use the Import->LW Projects menu item instead.
- Import of Kernel and driver projects is not supported.

Help

- The Help->Check Update dialog produces an error. This function is not supported.
- When Luminosity online help is used, the messages similar to the following ones can be printed in the terminal:

```
2018-02-22 08:06:39.462:INFO::Start Help Server:
Logging initialized @190473ms to
org.eclipse.jetty.util.log.StdErrLog

2018-02-22 08:06:39.555:INFO:oejs.session:Start Help
Server:DefaultSessionIdManager workerName=node0

2018-02-22 8:06:39.555:INFO:oejs.session:Start Help
Server: No SessionScavenger set, using defaults

2018-02-22 08:06:39.556:INFO:oejs.session:Start Help
Server:Scavenging every 660000ms
```

To disable such messages, change the

<inst_dir>/eclipse/luminosity.ini file by adding the following
line:

-Dorg.eclipse.jetty.LEVEL=OFF

after the line -vmargs where <inst_dir> is Luminosity installation directory and then re-launch Luminosity IDE.

Miscellaneous

- A diskless target may print the No space left on the device error message when the user attempts to debug or run an application. Rebuild the KDI reserving more free space in the file system.
- If Luminosity IDE ends incorrectly (by receiving a signal), the lwproxy process can remain running, thus preventing successful validation of a remote target in the subsequent Luminosity session. Remove this process before launching Luminosity again.
- SSH and FTP types of connection with the target do not work if the user account has no password.
- On Luminosity start, if License Session Manager is running for a cross platform that is registered in Luminosity IDE an error message may be displayed. You can safely ignore this error message.

SpyKer Issues

General Issues

- The Interrupts/Return from Interrupts events are the most frequent in a typical trace. These events typically consume the majority of the trace buffer space. Unless logging these events is requirement for a typical debug session, it is recommended that the user disables logging component. This will decrease the size of trace data, enhance the associated buffer space that is required, improve overall GUI performance, and create less impact caused by SpyKer on the target system.
- Wrap mode does not work if the trace is stored into a file on the target. To utilize the wrap mode without the GUI, use the :file ; command to disable continuous logging of events into a file. What follows is an example when using the wrap mode via a command file. This both allows wrap mode and deploys a stop trigger for the process exit event:

```
:etrig 9 ;
:buffers 40 512 0 ;
:file - ;
:wrap 1 ;
:start
```

When using the command file outlined above, SpyKer will run in the wrap mode. As soon as the process is complete, all contents are then written to the out.trc file.

• File names longer than 31 characters are not saved to the SpyKer traces correctly.

LynxOS-178 Issues

- The Library instrumentation feature is not supported on the LynxOS-178 targets.
- The displaying of a captured trace in Luminosity IDE may be slow.
- On LynxOS-178 targets, showtrace outputs may display an invalid timestamp for the very last event in a trace.

LOCI Issues

General Issues

- The Luminosity target server (lwsrvr) and the LOCI driver can affect some system performance characteristics such as system response time and context-switch time.
- Only verification, Target System Viewer, and SpyKer sessions are supported in LynxOS-178 when operating in Production Mode.
- Communication between LOCI Proxy and LOCI server can be slow if the serial line is used.

NFS Issues

Some operations with the NFS file system may fail if the file or directory permissions on the NFS host are not set correctly. A typical example occurs when the uid or gid files on the NFS host are different from the uid and gid on the target. Suggested ways to resolve this issue are:

- 1. Maintain the same uid and gid files on the NFS host and on the target.
- 2. Turn off root squashing for the exported NFS tree on the host and allow the root user on the target to handle the exported NFS tree as a root.
- 3. Use all_squash along with the anonuid and anongid options for the exported NFS tree. This will allow all client requests to operate correctly with uid and gid specified in the anonuid and anongid options.

Each solution has its own pros and cons. Solution 1 may not desirable or may not be applied if, for example, the file systems on the target and on the host were created independently. Solution 2 may not be desirable for the host administrator. Solution 3 allows one to prevent the root access to the exported tree but doesn't provide enough flexibility.

The access to the NFS files is handled on both sides. The NFS server performs an operation on a file according to its permissions and the client's uid and gid (after squashing in case the client's uid and gid are zero and no_root_squash is not specified). The target system also checks permissions and the user capabilities.

lwproxy Start-up on Windows

The lwproxy command may fail to start on Windows host if the older version of lwproxy was used previously on the same machine. If lwproxy reports the Can't open loci database or Couldn't import public key error and

then quits, open the registry by invoking the regedit command and manually remove the following registry key:

HKEY CURRENT USER\Software\Lynx Software Technologies, Inc.\LWPROXY

The Can't open loci database error can also occur if lwproxy is already running on behalf of the same user. In this case kill the old process and try again.

LynxOS-178 SSL Limitations

LynxOS-178 targets do not support SSL. Therefore, it is only possible to encrypt communications between <code>lwproxy</code> and LOCI clients (such as Luminosity) when using LynxOS-178 targets. The communication channel between <code>lwproxy</code> and <code>lwsrvr</code> will remain unencrypted.

lwsrvr Issues

The lwsrvr binary built for the LynxOS-178 Production Mode is named lwsrvr pdn. It supports the restricted set of sessions:

- Verification
- Target System Viewer
- SpyKer

To provide a SpyKer session, it calls the stracerd SpyKer daemon. Although the SpyKer daemon has the stracerd_pdn name in Production Mode, it should be copied into the target file system as stracerd.

LCS Issues

The following limitations are known to exist for this release:

- The LCS TCP/IP stack provides the restricted set of the routing messages. Specifically, it provides the following types of the routing commands:
 - RTM GET report metrics and other route information
 - RTM_ADD add a route
 - RTM DELETE delete aroute
- The route utility executed without parameters does not display the routing table information.
- The lcsnetstat -Rcommand does not display any arp information of the interfaces.
- The arp <hostname>command does not display host specific arp information of the interfaces.
- The ifconfig -acommand does not display any status of the interfaces.
- The ifconfig utility executed without an interface name does not display the status of interfaces.
- The recvfrom() call is not available for TCP sockets.
- The netstat utility is not supported by LCS. lcsnetstat should be used instead.

Please note that only an LCS interface connected to a physical interface can have the MTU configured.

LCS Limits

Table 3-2 outlines the numerical default limits used in the LCS v2.2.0. Socket limits can be changed with <code>SockLim</code> option. The TCP send and TCP receive buffers size can be changed with <code>TCP_SockBufSize</code> option. Please refer to the <code>Lynx Certifiable Stack v2.2.0 User's Guide</code> for the further details.

Table 3-2: LCS Numerical Default Limits

Limit	Value	User Impact if Limit is Reached	Scope	Description
All sockets	256	The ENOBUFS (No buffer spaceavailable) error is returned.	VM	The limit on the total number of all the sockets (tcp, udp, and raw sockets) in the current VM.
Network interfaces	8	The ENXIO (No such device or address) error is returned.	System	The limit on the number of network interfaces including the loopback interface lo that is always present.
Interface name	16	A longer name is truncated silently.	System	The limit on the length of a network interface name.
IP addresses	16	The ENOBUFS (No buffer spaceavailable) error is returned.	Network controller	The limit on the number of IP addresses that can be configured for a network controller.
Multicast IP addresses	20	The ETOOMANYREFS (Too many references) error is returned.	Socket	The limit on the number of multicast IP addresses that can be configured for a socket.
Host routes	31	The ENOBUFS (No buffer space available) error is returned.	VM	The limit on the number of host route entries which can be configured for the current VM.
Net routes	31	The ENOBUFS (No buffer space available) error is returned.	VM	The limit on the number of net route entries that can be configured for the current VM.
Address resolution entries	32	No error is returned. Result can be checked using RTM_GET ioctl().	VM	The limit on the number of entries in the address resolution table of the current VM.

Table 3-2: LCS Numerical Default Limits (Continued)

Raw sockets send	94	EMSGSIZE (Message too long) error is returned.	System	The limit on the size of the message sent via a raw socket.
TCP receive buffer	32768	No error is returned for the setsockopt() call. The TCP receive buffer size is set to the maximal value (32768 bytes) silently.	System	The limit on the TCP receive buffer size. 4 bytes are reserved for a size of data in the buffer. So, the data size is limited to 32768 - 4 = 32764 bytes.
TCP send buffer	32768	No error is returned for the setsockopt() call. The TCP send buffer size is set to the maximal value (32768 bytes) silently. The EMSGSIZE (Message too long) error is returned for the send() call.	System	The limit on the TCP send buffer size. 4 bytes are reserved for a size of data in the buffer. So, the data size is limited to 32768 - 4 = 32764 bytes. An application cannot send more than 32764 bytes using one send () call.
TCP accept queue size	256	The ECONNREFUSED (Connection refused) error is returned.	Socket	The limit on the size of an accept queue of each listening TCP socket.
MTU	1500	The EINVAL (invalid argument) error is returned.	System	Maximum allowed MTU value

There are a number of buffer pools used in LynxOS-178 for passing network messages through the TCP/IP stack. User's code gets the ENOMEM error when the corresponding pools are full in case of RAW, UDP sockets and blocks or gets the EWOULDBLOCK error in case of TCP sockets.

Note that these pools are reserved when the lcsd daemon is started. Therefore, each VM has its own pools.

Table 3-3: LCS Buffer Pools

Pool	Buffers Number	Buffer Size	Where Used
Interface pools (1-7)	MAX_SOCKETS	2 K	Link layer: Send/receive operations for the N-th networkinterface.
Main	3	2 K	IP layer: Send IPfragments (when message size > MTU). UDP layer: Send small (< 2K) messages.
Reassemble	<pre>IP_FragQueueSize* * X IP_MaxFragCount** *</pre>	2 K	IP layer: Receive IP fragments for reassembling.
Large buffers	IP_FragQueueSize**	64 K	IP layer: Store the reassembled from the received IP fragments message. UDP layer: Send large (>= 2K) messages.
TCP	MAX_SOCKETS* x32	2 K	TCP layer: Send/receive TCP messages.
Raw sockets	8	2 K	RAW layer: Receive raw socket messages.
ICMP	4	2 K	RAW layer: Send raw socket messages. IP layer: Send ICMP echoreply.
Small buffers	MAX_SOCKETS* x32	128 b	RAW layer: Send ARP requests, routing get requests. IP layer: Send IGMP response. UDP layer: Send UDP messages (store UDP header in thebuffer). TCP layer: Send TCP control messages (SYN, ACK, RST, FIN, and so on).

Default values for constants in table (refer to the *Lynx Certifiable Stack v2.2.0 User's Guide* for the description of these variables):

- * MAX_SOCKETS: 256
- ** IP_FragQueueSize: 10
- *** IP_MaxFragCount: 70
